

The Evolution of IT: A Road to Containers

Minnesota Government IT Symposium
December 11, 2019

Damien Eversmann
Senior Solutions Architect
damien@redhat.com

What we'll be discussing today:

- Who am I?
 - ... and why should you care?
- The official abstract for this session.
 - ... and how we'll diverge from most of it.
- A grand history of software development
 - It's not like history class, I promise.
- Software development methodologies and technologies
 - All the cool flashy stuff that developers use and do
- Containers
 - Buckets, boxes and bins
- Orchestration
 - ... and I won't even bring out my son's trombone.
- Putting it all together
 - And, if you're good, a demo

Who the heck am I?

Damien Eversmann

- Developer
- Development Manager
- Systems Engineer
- Enterprise Architect
- Red Hat Solutions Architect

Who Am I Really?

■ Why am I here?

What should you be thinking about as you plan for the next 5 years in IT?

Specifically:

- Containers
- DevOps
- Automation
- What else?

Join us for a brief history of innovation through the lens of IT development and how that history has led to Containerization. Along the journey, we will explore key systems challenges from 20 years ago and the challenges of today: How are these different and what is similar? What is the value of Containerization to Government agencies? Learn why Container adoption is increasing quickly due to the efficiencies it creates and the innovation it enables. Our discussion will conclude with a few examples of why and how organizations are using Containers today.

Brief Diversion:

A quick discussion of open

Product development model

Participate

We participate in and create community-powered upstream projects.

Integrate

We integrate upstream projects, fostering open community platforms.

Stabilize

We commercialize these platforms together with a rich ecosystem of services and certifications.

Open source culture

Collaboration

Transparency
(both access and the ability to act)

Shared problems are
solved faster

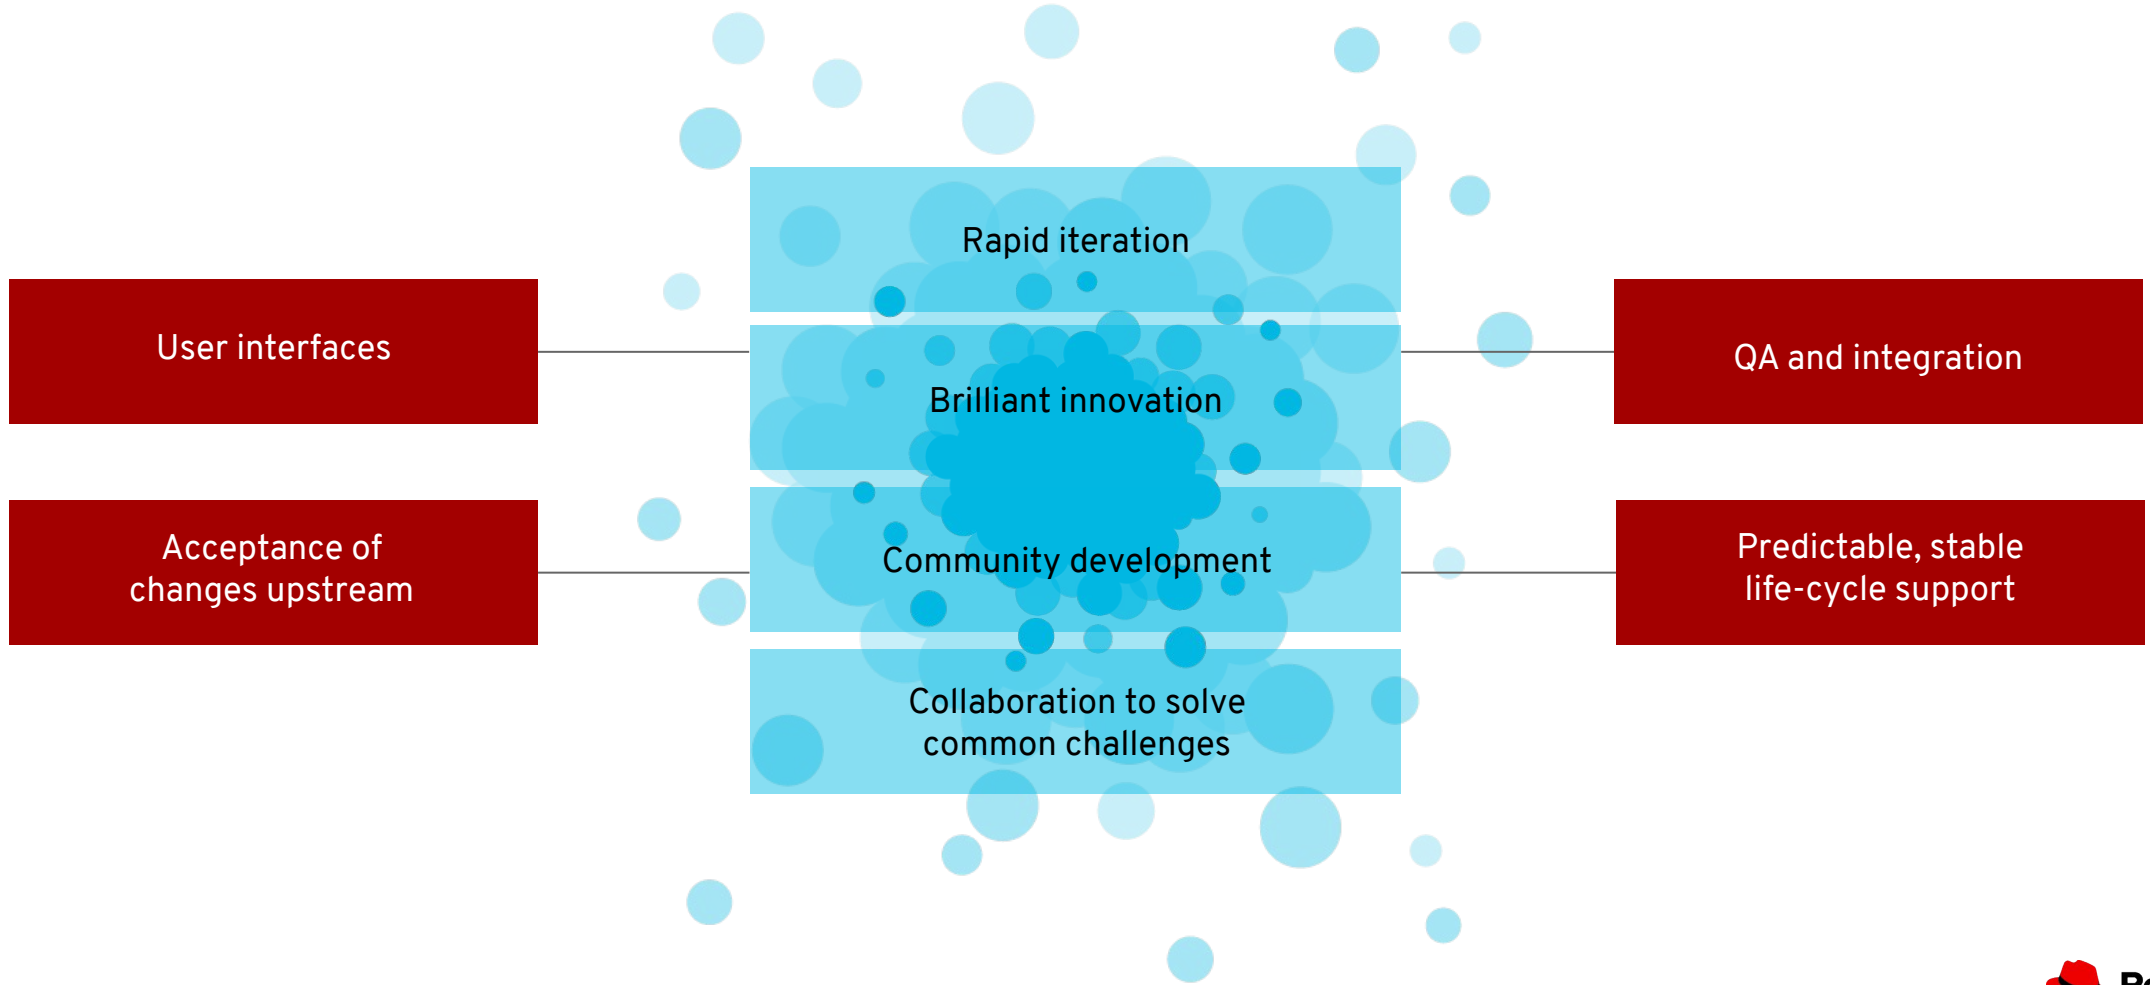

Working together creates
standardization

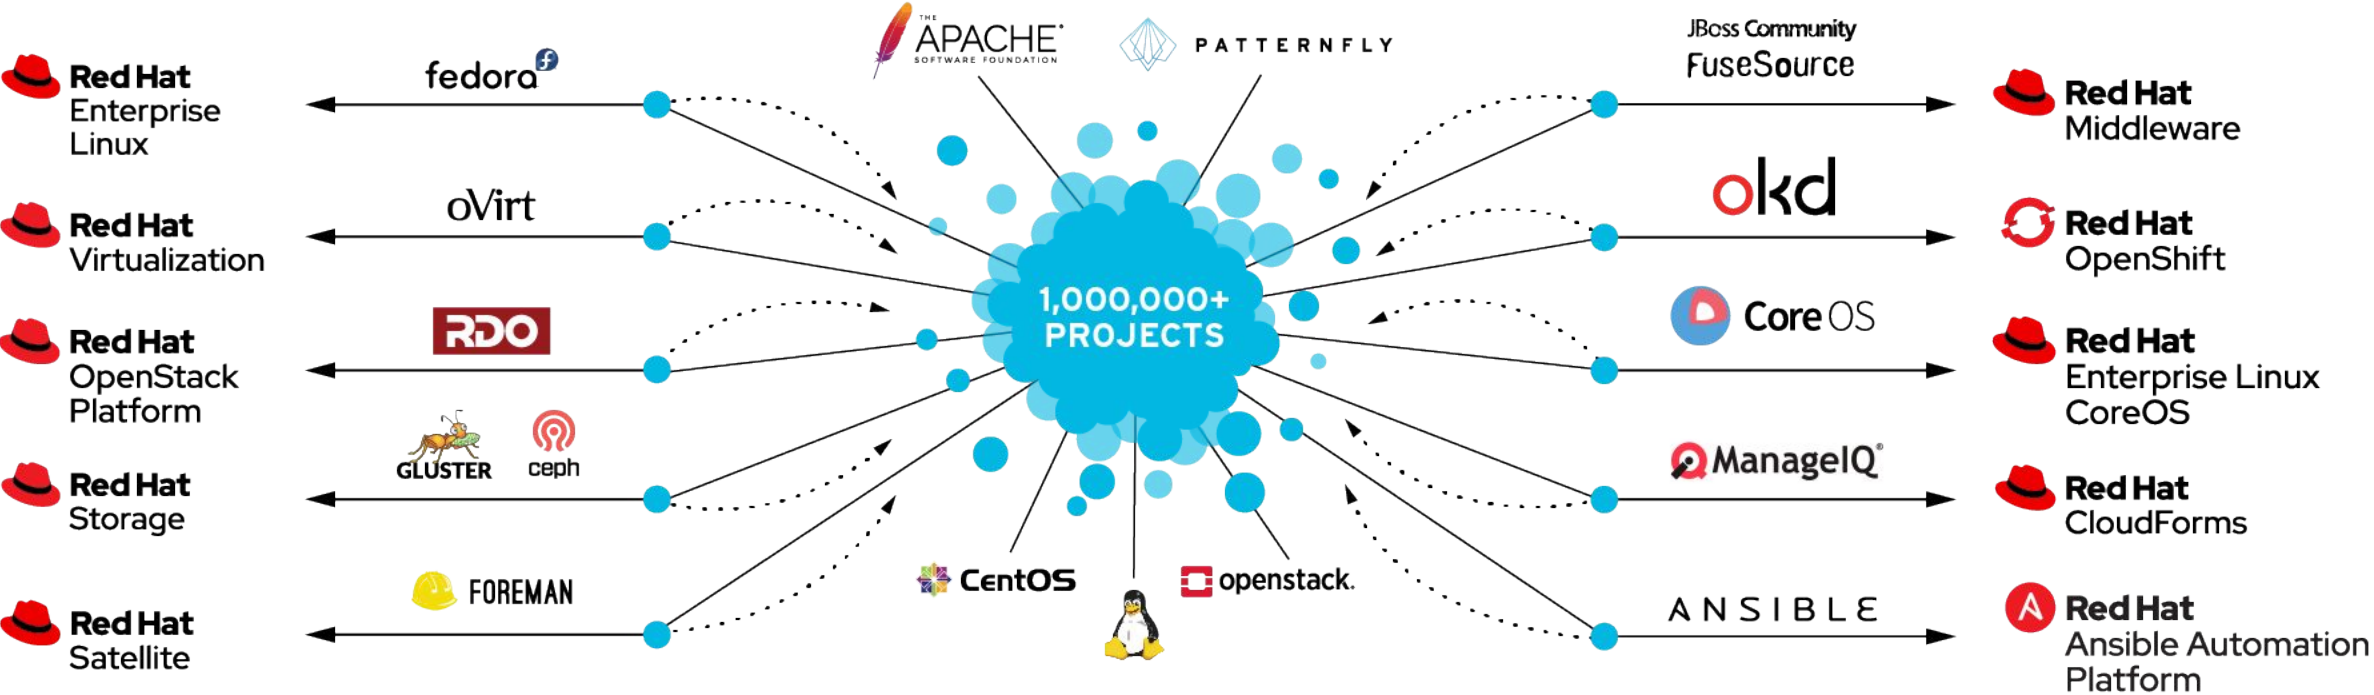

Open source fuels rapid innovation

Open source enterprise solutions

From communities to enterprise

communities-to-enterprise-full-201906m

**AND NOW BACK TO
OUR REGULARLY
SCHEDULED
PROGRAMMING**

In order to discuss modern solutions, we need to discuss how we got here to begin with.

Stage 1: The Monolith

Monolith, the 1st MAINFRAME

ALL
DEVELOPERS

ALL
USERS

Monolith, the 2nd MONOLITHIC APPLICATIONS

APPLICATION A
DEVELOPERS

APPLICATION A
USERS

APPLICATION B
DEVELOPERS

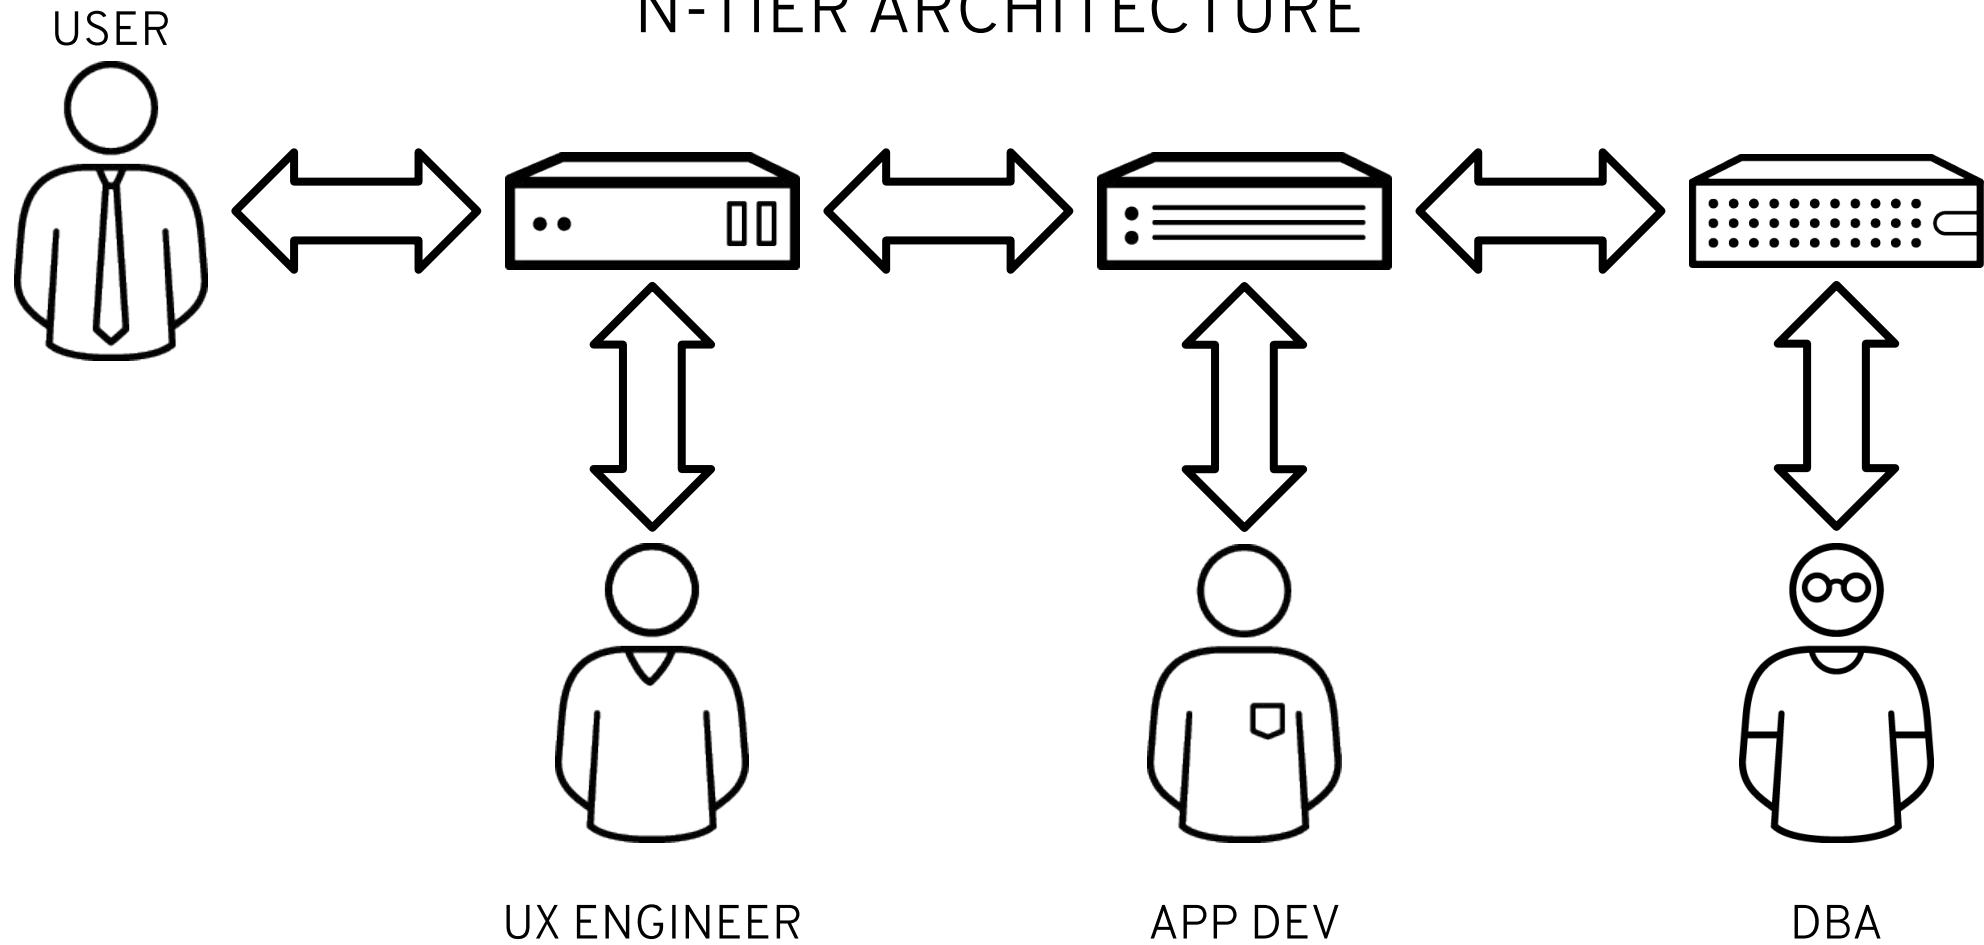

APPLICATION B
USERS

Stage 2: Layered Applications

Layered Applications N-TIER ARCHITECTURE

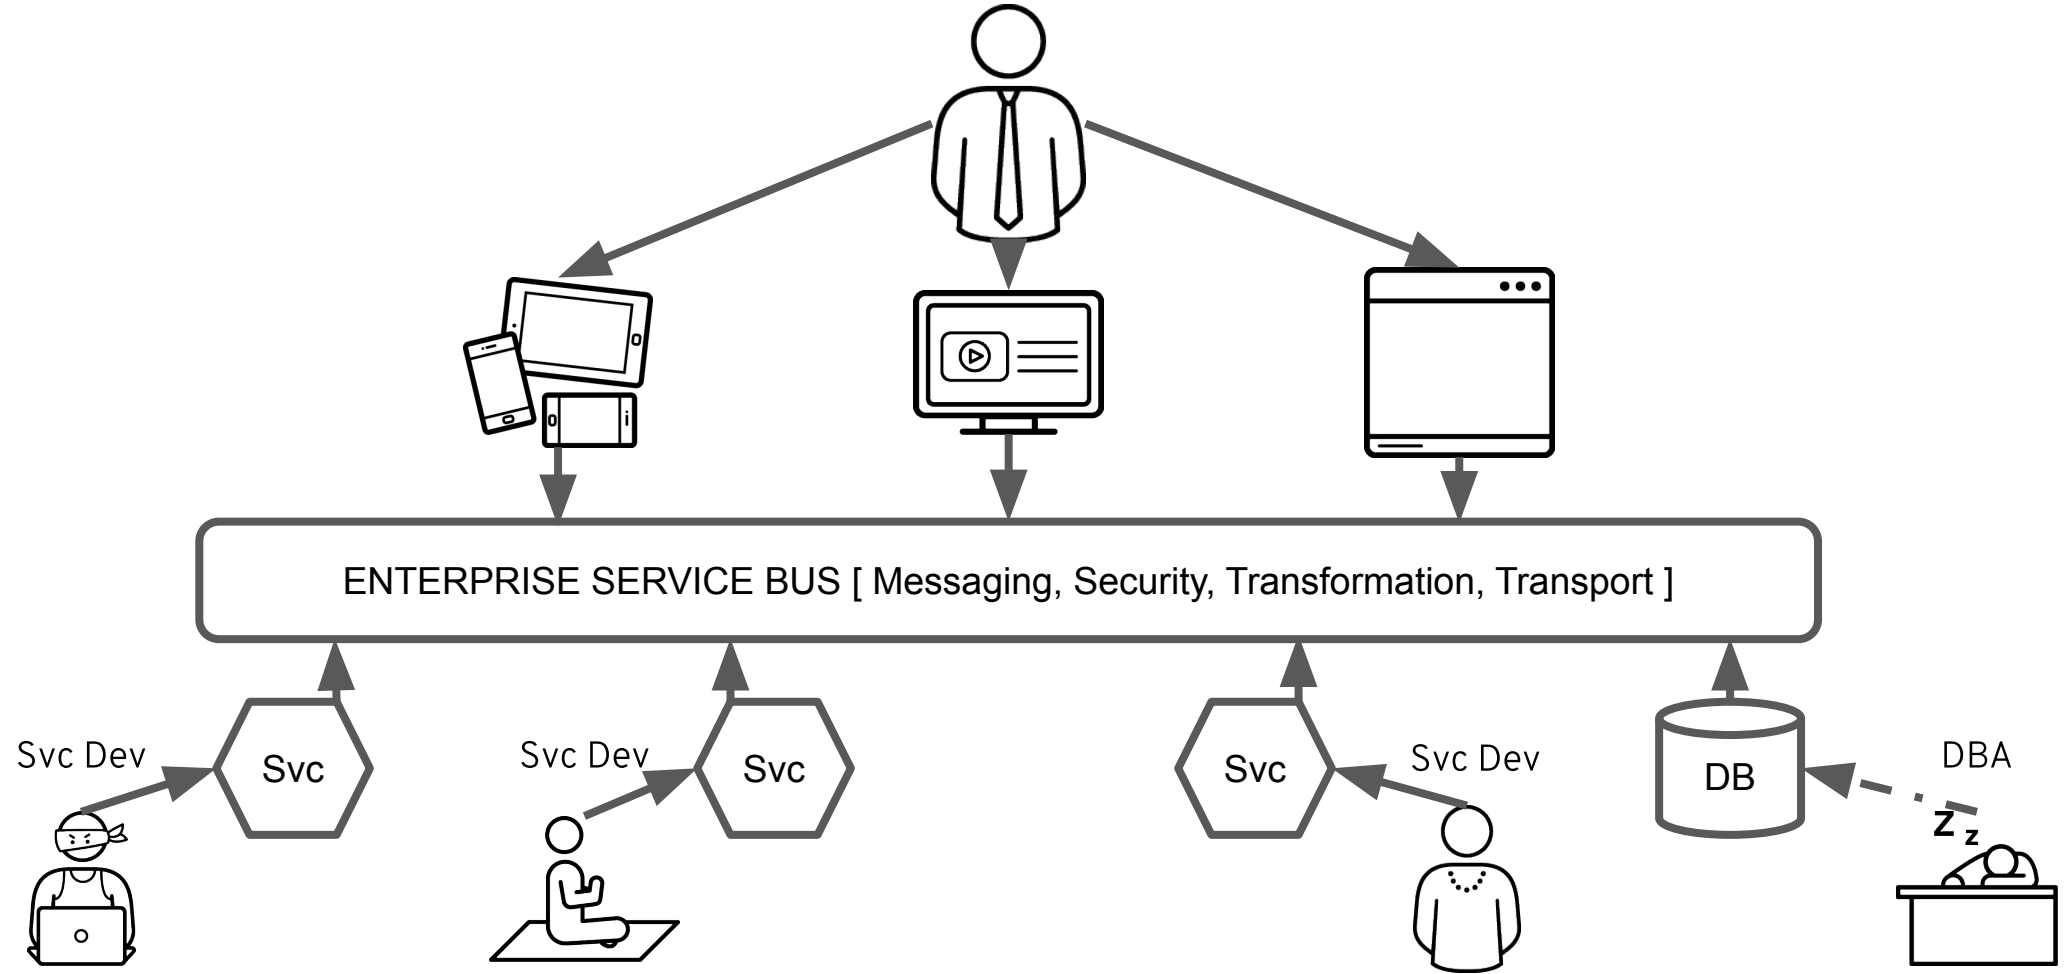

Benefits:

- Developer Specialization
- More Efficient Resource Utilization
- Better Security Granularity

Stage 3: Services Based Architectures

Services-Oriented Architecture (SOA)

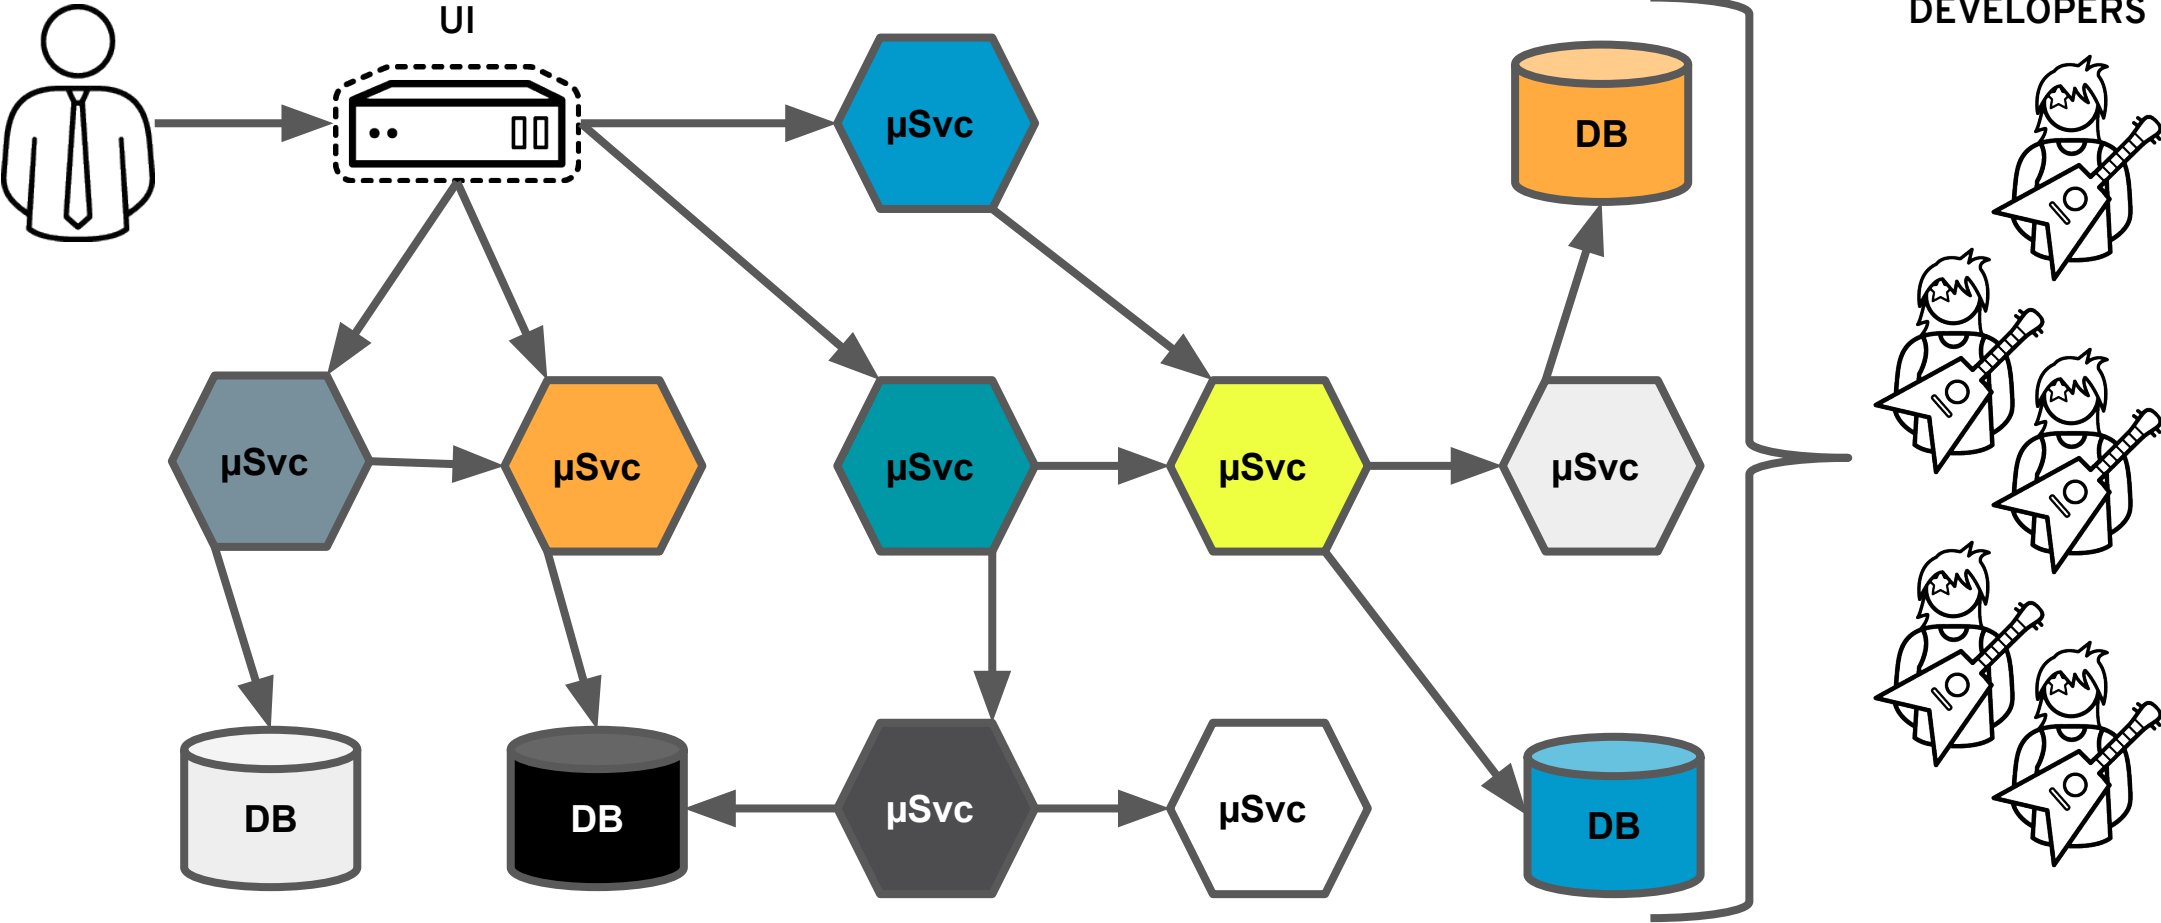

Benefits:

- Even More Developer Specialization
- Better Security Granularity
- Decoupling of Disparate Resources
- Multiple Delivery Mechanisms

Microservices

Benefits:

- Even More Developer Specialization
- Best Security Granularity
- Efficient Scaling
- Platform Agnostic
- Hybrid-Cloud Friendly

Where do Containers fall
into all this already?

The Problem

Applications require complicated installation and integration every time they are deployed

The Solution

Adopting a container strategy allows applications to be easily and consistently shared and deployed.

Containers - An Evolution in Application Deployment

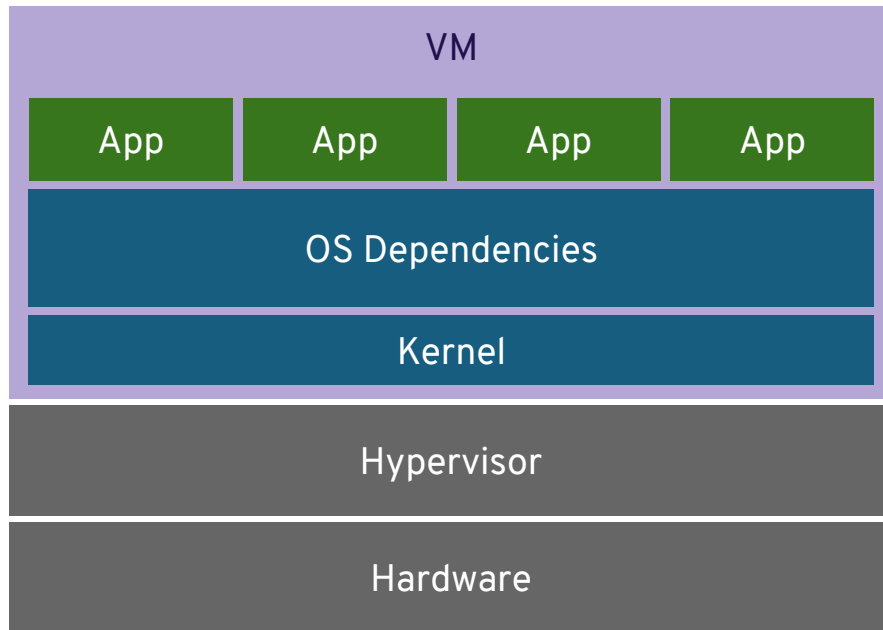

Enable efficiency and automation for microservices, but also supports traditional (even monolithic!) applications

Enable faster and more consistent deployments from Development to Production

Enable application portability across infrastructure footprints

- Physical, Virtual, Private & Public Cloud

Virtual Machines versus Containers

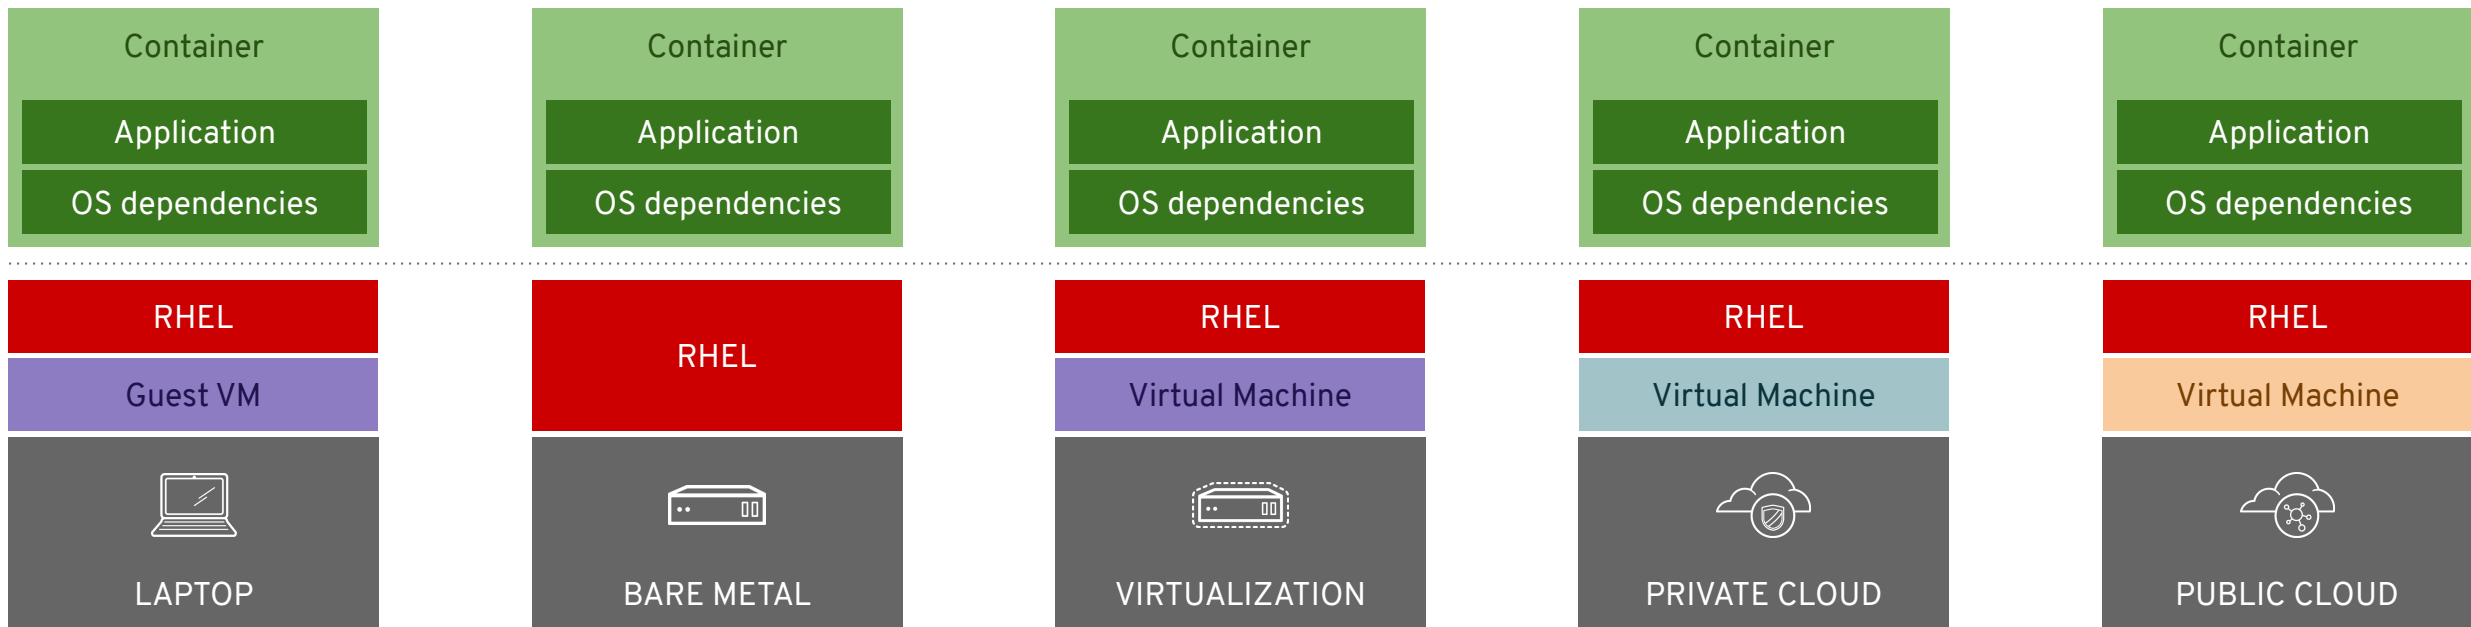

Virtual machines are isolated,
apps are not isolated

Containers are isolated,
apps are isolated

Application Portability With Containers

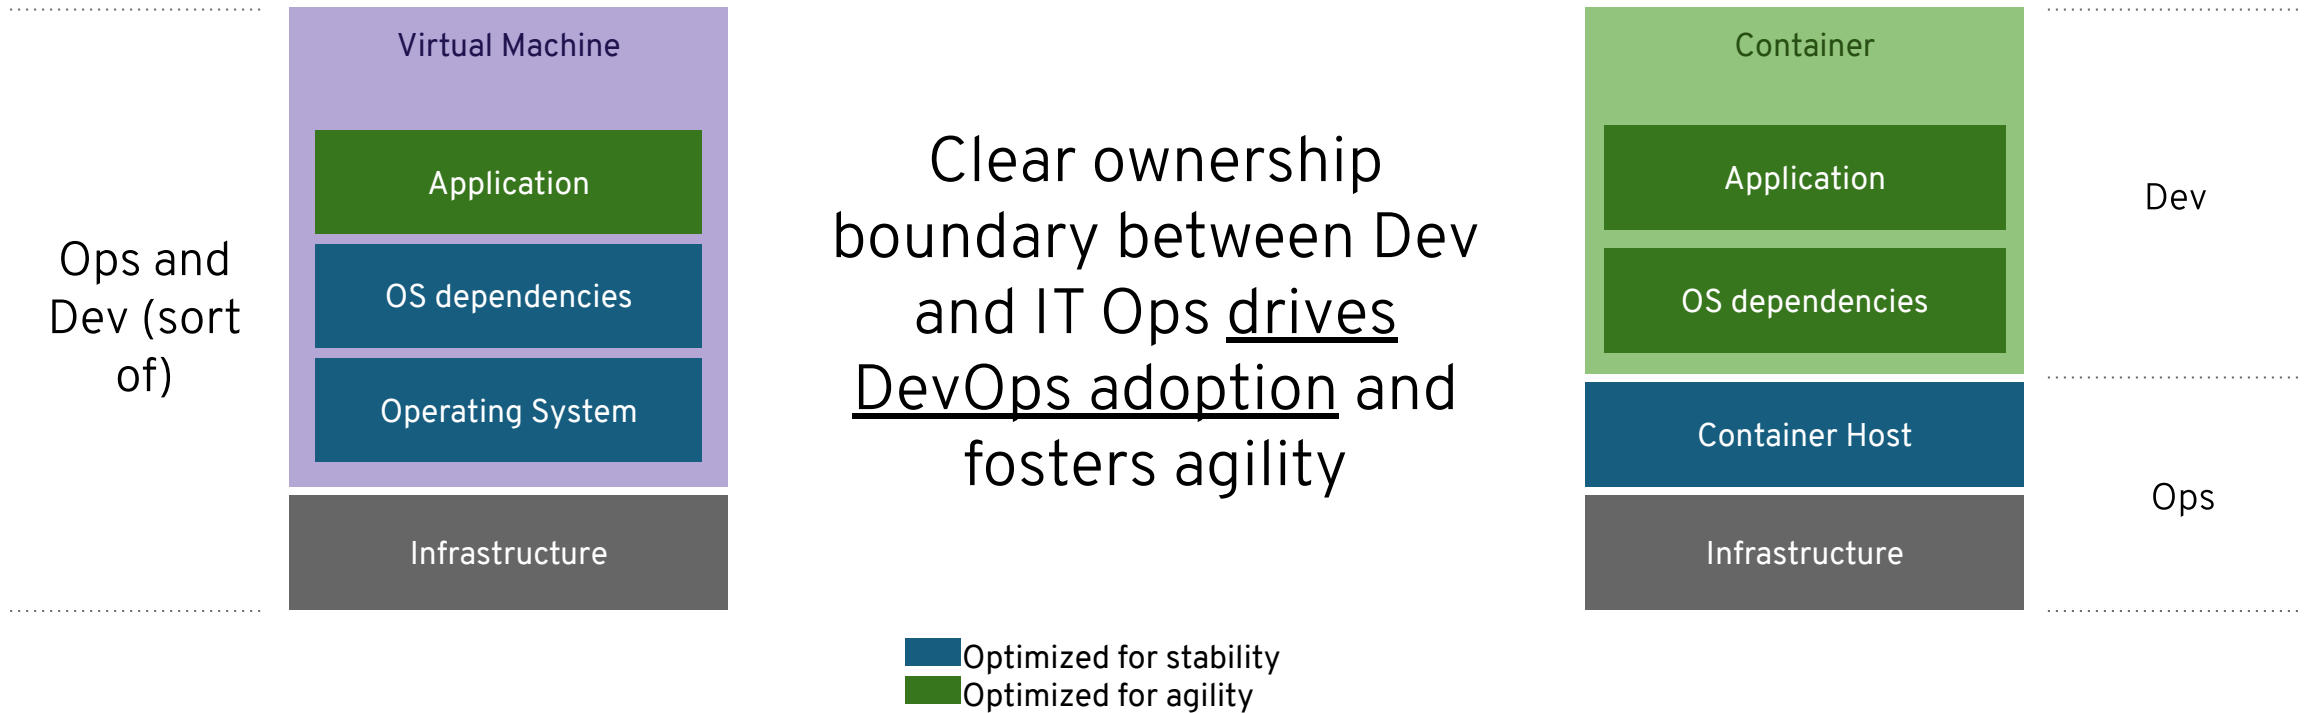

RHEL Containers + RHEL Host = Guaranteed Portability
Across Any Infrastructure

Containers Support DevOps

Virtual Machines and Containers

Containers Are Everything to Everyone

INFRASTRUCTURE

APPLICATIONS

- Sandboxed application processes on a shared Linux OS kernel
- Simpler, lighter, and denser than virtual machines
- Portable across different environments

- Package my application and all of its dependencies
- Deploy to any environment in seconds and enable CI/CD
- Easily access and share containerized components

Containers Transform

Applications

Monolith

The Business Benefits of Containers

5 year ROI

531%

Average Annual Benefits
per 100 Developers

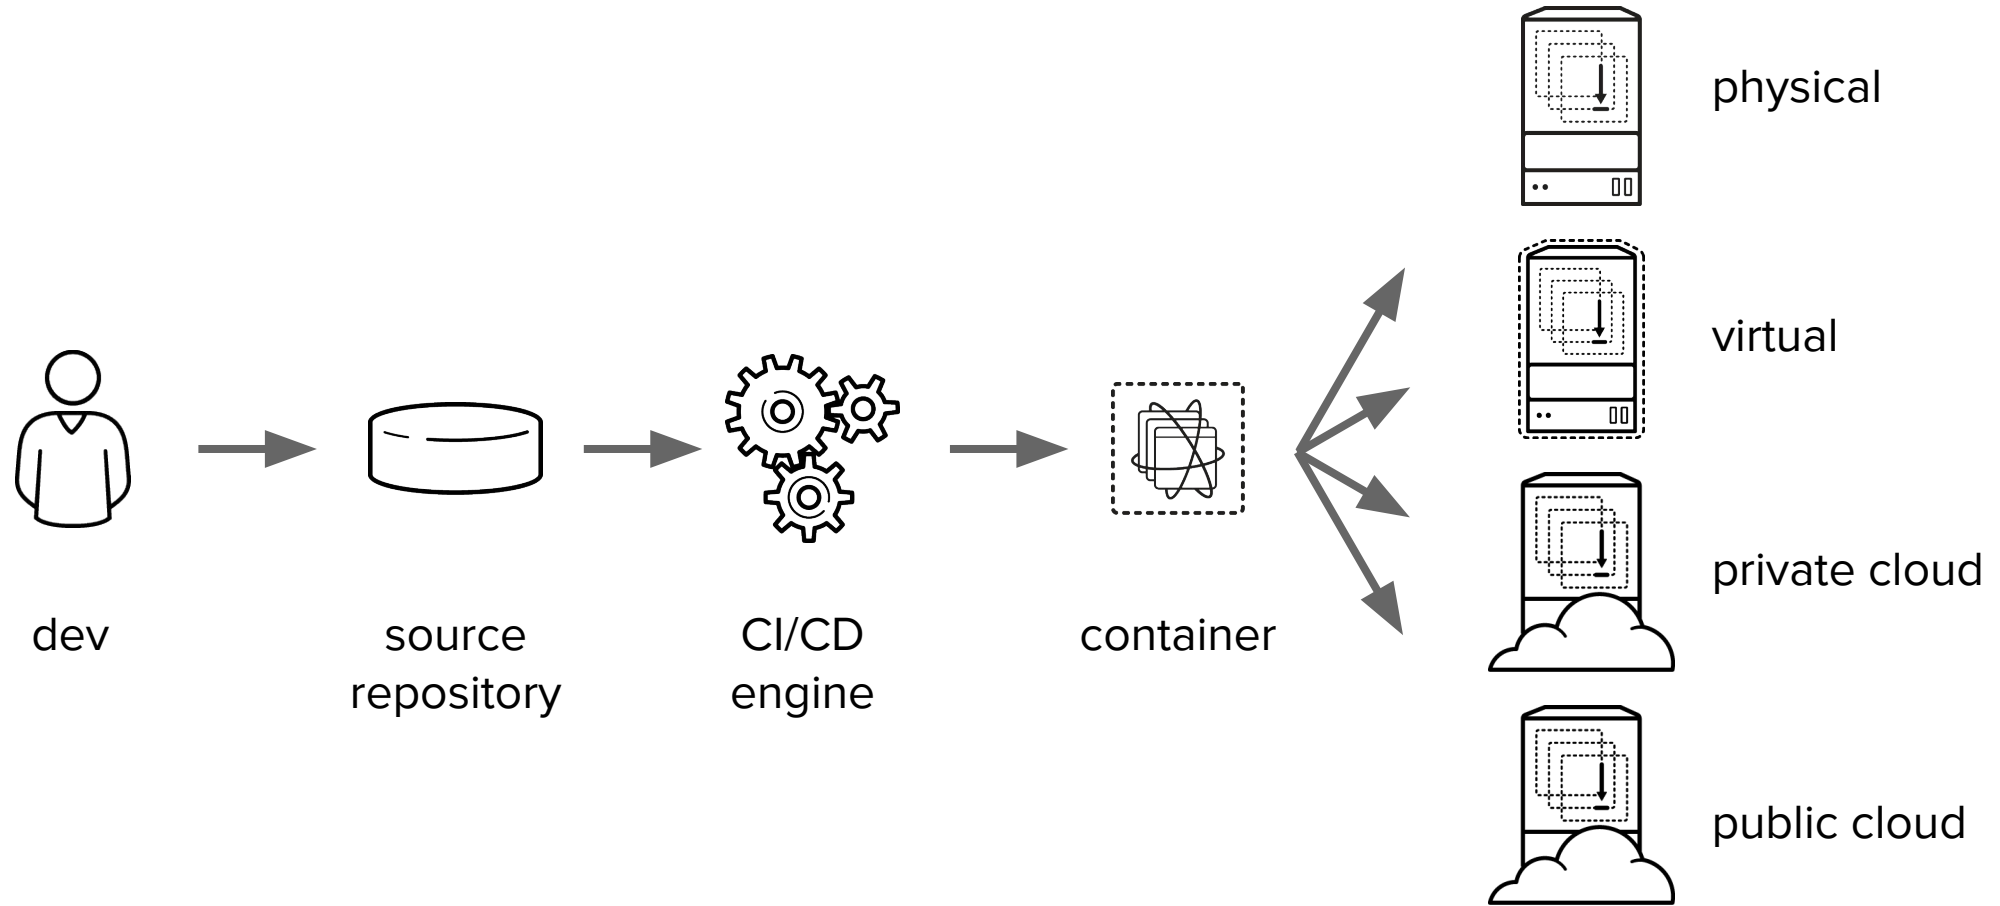

\$1.29M

Payback Period

8 Months

Containers Save the Day

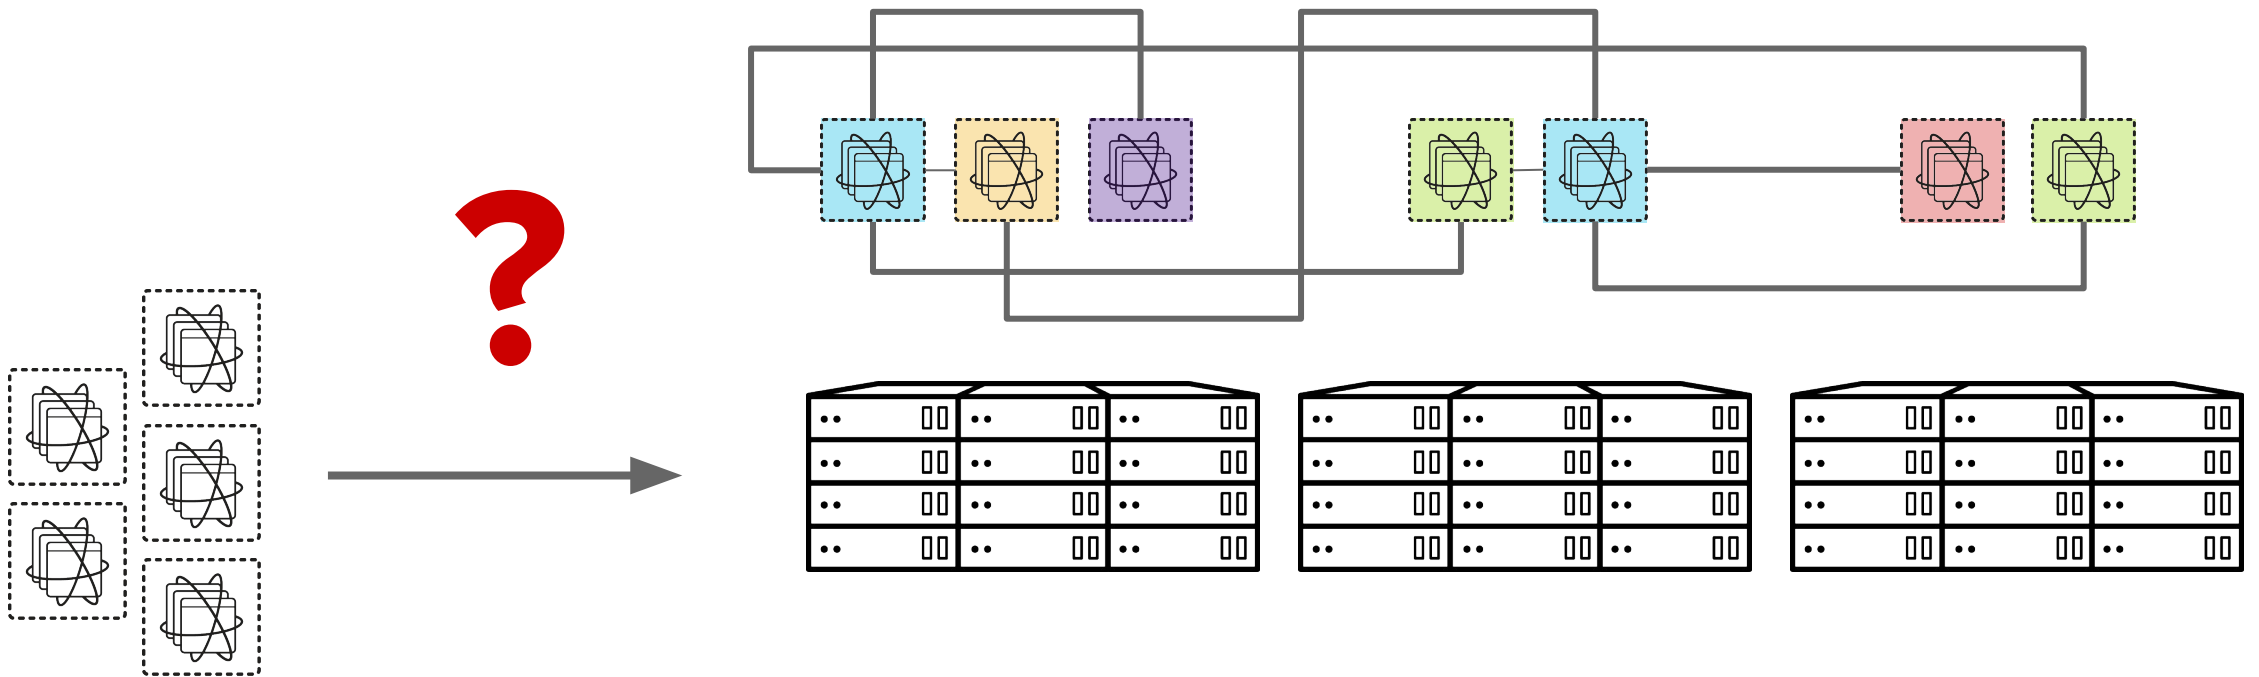

Great! We will use
containers! Thx cya!

... But wait, there's more.

What about a container running at scale?

What about multiple coupled containers running at scale?

Containers Alone Aren't Enough

Scheduling

Decide where to deploy containers

Lifecycle and health

Keep containers running despite failures

Discovery

Find other containers on the network

Monitoring

Visibility into running containers

Security

Control who can do what

Scaling

Scale containers up and down

Persistence

Survive data beyond container lifecycle

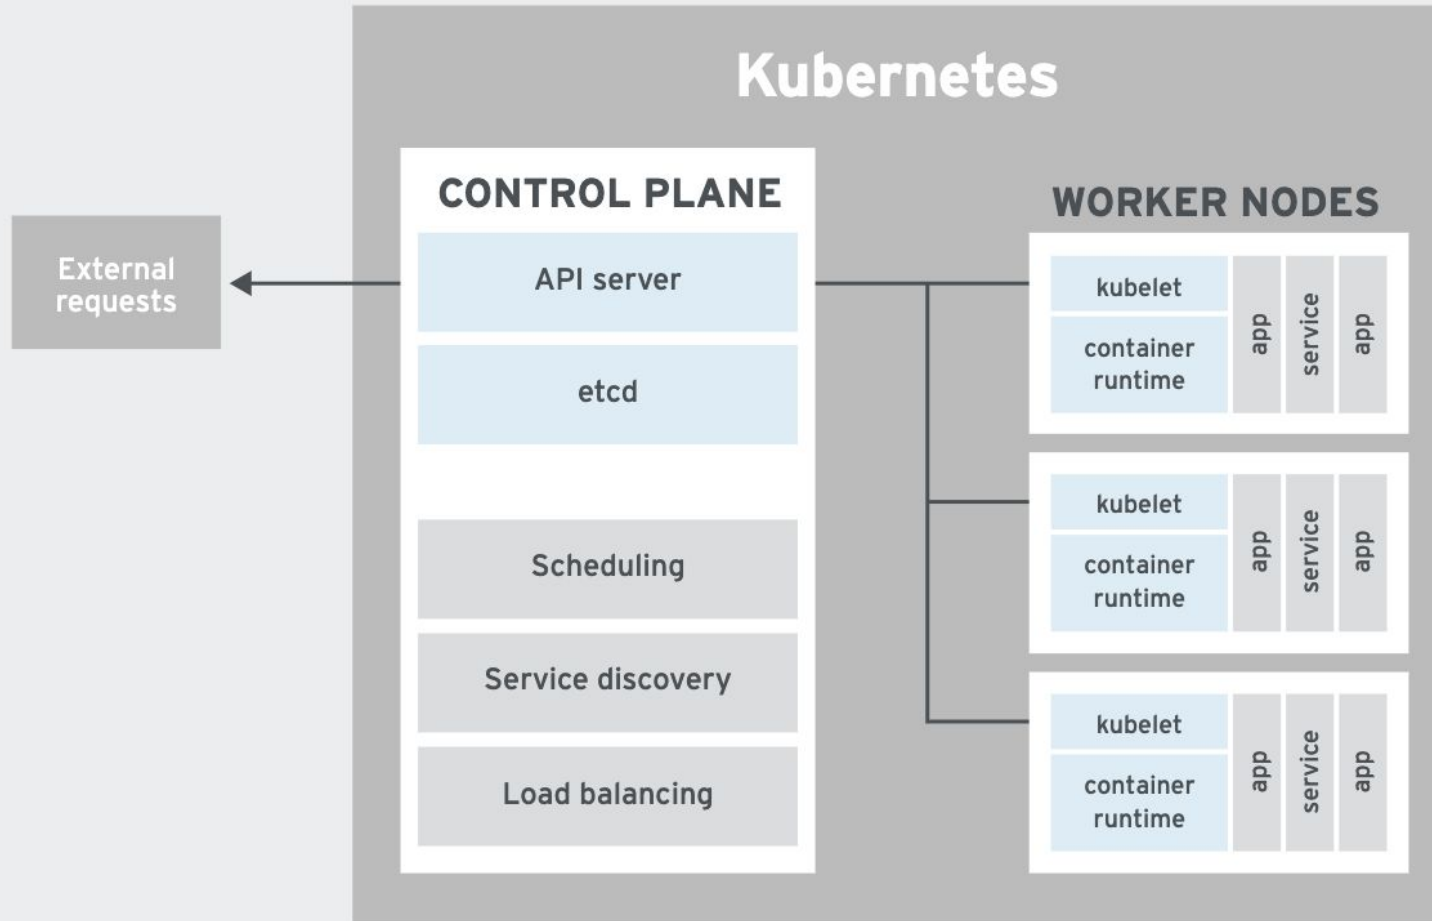

Aggregation

Compose apps from multiple containers

Kubernetes to the Rescue

Kubernetes is an open-source system for automating deployment, operations, and scaling of containerized applications across multiple hosts.

Kubernetes is a cluster of simple worker nodes running containers and managed by one-or-more control nodes.

Container Orchestration With Kubernetes

Enterprise Demands More

- Standard operating environment
- Application services
- Metrics and logging
- Infrastructure management
- Self service portal
- Persistent storage
- Etc.

OpenShift is a platform that enables enterprise-grade, container-based application development

What is OpenShift Really?

Trusted Container OS

Trusted by Fortune Global
500 companies

Container Orchestration

Kubernetes
Prometheus
Red Hat Storage
