

MEDICOM

Eliminate manual bottlenecks and improve the continuum of care.

Time-saving automation capabilities paired with a federated model to keep data secure and outside of the cloud.

MEDICOM INTRODUCTION

Problem: Disparate health information solutions create bottlenecks in patient care including delays of care, reimaging, and manual processes.
Question: How can health systems automatically exchange clinical information with patients and providers to reduce costs?

SECURITY FIRST APPROACH

Unlike the competition who have focused on the cloud, Medicom designed its health information exchange to follow the decentralized blockchain model. This means that data sent from one facility to another is sent directly through an encrypted conduit between health care facilities and not through Medicom servers in the cloud. Thus, saving time and reducing overhead costs.
